

Fork Positioner for Forklifts

Fork Positioner for Forklifts - A fork positioner is actually a tool constructed out of high quality materials meant to withstand the most demanding operations and work environments. This particular piece of equipment enables drivers to be able to maneuver the blades hydraulically without leaving the seat. Side shifting models have the extra ability to laterally position the entire load or the arms so as to facilitate more accurate lifting and position in a faster and much more efficient manner.

The fork pocket is somewhat unique and can enable the one operating it to be able to securely swing the blades into position without any fear of damaging the positioning cylinders. This can allow the driver the option to perform independent or simultaneous fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into blade positioners on existing units.
